

Salesai-pro development approach

AI Agent Architecture — SalesAI Pro Framework Overview

1. AI Agent Framework Correlation

Step	Framework Component	SalesAI Pro Implementation	Status
1	Define Purpose & Scope	Sales & Marketing AI agent covering full revenue lifecycle: attract leads via campaigns, qualify via AI chat, close via auto-proposals and payments. Constraints: multi-tenant isolation, GDPR compliance, INR pricing.	In progress
2	System Prompt Design	Per-module prompts with personalisation tokens (name, company, role, product_interest). AI AD Generator generates personalized ads based on the user products.	Done
3	Choose LLM	Primary: Gemini Models (Flash/Pro) / Groq (Llama Models). Temp 0.7 for outreach, 0.4 for proposals. Context window handles long chat histories. Cost/latency balanced via model routing logic.	In progress
4	Tools & Integrations	APIs: SendGrid (email + open/reply webhooks), LinkedIn DM API, Stripe & Razorpay (payments). AI agent used as tool: Proposal Gen is invoked by Chat AI when qualified=true. Lead enrichment lookup via Website URL field.	Planned
5	Memory Systems	Episodic: conversations table stores full chat history per lead. Working: in-request context window with lead profile + product_interest. Vector DB (RAG): 50MB knowledge base per tenant (Pro+ plan). SQL: PostgreSQL with tenant_id row isolation.	Planned

Step	Framework Component	SalesAI Pro Implementation	Status
6	Orchestration	Workflow Engine: Celery + Redis (DAG scheduler + task queue). Triggers: on_lead_created fires outreach. Routes: Reply? Chat. Qualified? Proposal. Closed? Done. Agent2Agent: Chat AI triggers Proposal Gen. Error handling: retry queues + dead-letter logging.	Planned
7	User Interface	Chat interface: branded AI Chat Portal (light theme, SSE streaming, JWT invite tokens). Web app: 11-screen internal React dashboard (dark theme). API endpoint: 15+ REST routes + webhook layer. Lead-facing: public Proposal Viewer + Lead Capture Form.	Done
8	Testing & Evals	AI Insights cards (LLM-generated, cached 1hr) provide quality metrics. Campaign Analytics: step performance, send-time heatmap, reply rate by step. Unit tests, latency benchmarks, and eval harness targeted for P1 sprint.	Planned

2. Technology Stack

Layer	Technology	Purpose
LLM Layer	Anthropic Claude / OpenAI GPT-4o	Outreach email generation, AI chat responses, proposal content generation, AI insight cards
Email	SendGrid	Transactional sends, open-event tracking webhooks, inbound reply-parse webhooks
Payments	Stripe / Razorpay	Checkout session creation, checkout.session.completed webhook, payment status DB updates

3. Feature Implementation Priorities

Priority	Feature Area	Key Deliverables
P0 — MVP	Lead Capture	Lead Form UI, form validation, POST /leads endpoint, leads DB table, lead model with id/email/name/company/role
P0 — MVP	Automated Outreach	LLM prompt template, LLM API integration, SendGrid setup, email sender function, on_lead_created trigger, email log in DB
P0 — MVP	Email Reply Capture	Webhook /email-reply, email parser, lead-to-reply matching via email address, message storage in conversations table
P0 — MVP	AI Chat Portal	Chat send endpoint with SSE streaming, JWT invite token generation, full chat history, branded light-theme portal UI
P0 — MVP	Proposal & Payment	LLM proposal generator, proposals table, public viewer URL, Stripe checkout session, /webhook/stripe payment confirmation
P1 — Next	Orchestration/Infra	Celery async background jobs, event system replacing DAG, duplicate lead prevention (409 + email match), source tagging, receipt emails
P2 — Later	Optimisation	Send-time ML optimisation, unit tests & eval harness, RAG knowledge base (pgvector), CRM sync (HubSpot/Salesforce), revenue forecasting, WhatsApp/SMS
